The Interagency Monitoring of Protected Visual Environments (IMPROVE) is a long-term air pollution measurement program designed to document and track visibility in protected areas. IMPROVE samples and analyzes the haze particles that impair visibility so their sources can be identified and addressed.

Samples Successfully Collected and Analyzed in 2020 by Filter Type. PTFE: 99 (81.1%), Nylon: 94 (77.0%), Quartz: 99 (81.1%)

The plots below show temporal trends for site 30-049-9000 alongside network-wide CSN and IMPROVE median concentrations. The top plot shows the variability of the reconstructed fine mass (RFM) concentrations during 2020; RFM can only be calculated if all three filters collected on a sampling day are valid. The bottom plot illustrates the long-term trends of ambient concentrations; the gray shaded region represents the range of values measured each year at this site, illustrated using the 10th and 90th percentile values.

The following plots summarize the chemical composition of particles collected at this site. The monthly averaged compositions calculated from 2016-2020 data are shown on the left while compositions for the day with the highest measured concentrations during 2020 are shown on the right.

### Average Monthly Particle Composition

#### Components Calculation Natural Sources Anthropogenic Sources
Salt $1.8 \cdot \text{Chloride}$ Ocean spray, dry lakebeds Chemical manufacturing, lake consumption
Soil Dust $2.2 \cdot Al + 2.49 \cdot Si + 1.63 \cdot Ca$ Soil resuspension, dust storms Construction, agriculture, deforestation, unpaved roads
+ $2.42 \cdot Fe + 1.94 \cdot Ti$ long-range transport Motor vehicles, wood burning, smoking
Soot $\text{Elemental Carbon}$ Wildfires Motor vehicles, cooking oils, household cleaners
Organic Matter $1.4 \cdot \text{Organic Carbon}$ Plants, animals, wildfires Fertilizer, stock yards, chemical manufacturing
Nitrate $1.29 \cdot \text{Nitrate}$ Plants, animals Coal-fired power plants, chemical manufacturing
Sulfate $4.125 \cdot \text{Sulfur}$ Volcanism

The following map shows the average RFM concentrations for nearby sites in both CSN and the rural IMPROVE Network. The point shapes indicate which network the sites are associated with. The color bar indicates the average annual RFM concentration (micrograms per cubic meter) measured at each site in 2020.
