

Proctor Maple Research Facility (PMRF) 2016 Site Report

The Interagency Monitoring of Protected Visual Environments (IMPROVE) is a long-term air pollution measurement program designed to document and track visibility in protected areas. IMPROVE samples and analyzes the haze particles that impair visibility so their sources can be identified and addressed.

Percent of Samples from PMRF Successfully Collected and Analyzed Per Year

2001	2002	2003	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016
94	95	99	95	99	96	98	100	93	94	94	99	100	97	97	96

In the plots below, mass concentrations measured at Proctor Maple Research Facility give a sense of the seasonal trends of air quality in the area as well as show significant air quality events such as wildfires and dust storms. These are plotted alongside the average measurements across the IMPROVE network as well as its related Chemical Speciation Network (CSN). The CSN sites are located in urban areas where the populations are highest. In general, lower concentrations would suggest better visibility. The lower plot shows annual median concentrations with a gray shaded region to represent the 10th and 90th percentiles.

Daily Fine Particle Mass Concentrations in 2016

Trend in Fine Particle Mass Concentration Since 2000

The following plots summarize the chemical composition of particles collected at this site on a monthly average (left) and for the day with the highest measured mass during 2016 (right).

Species	Natural Sources	Human-Made Sources
Salt	Ocean spray, dry lakebeds	Chemical manufacturing, lake consumption
Soil Dust	Soil resuspension, dust storms	Construction, agriculture, deforestation, unpaved roads
Soot	Wildfires	Motor vehicles, wood burning, smoking
Organic Matter	Plants, animals, wildfires	Motor vehicles, cooking oils, household cleaners
Nitrate	Plants, animals	Fertilizer, stock yards, chemical manufacturing
Sulfate	Volcanism	Coal-fired power plants, chemical manufacturing

The following map shows the average mass concentrations for both IMPROVE and the urban Chemical Speciation Network (CSN) sites in the region. The symbols indicate which network the sites are associated with. The color bar indicates the average annual mass concentration (micrograms per cubic meter) measured at each site in 2016.
